

# Analyze 100% of your system changes

## How it Works

### World-class distributed tracing and metrics

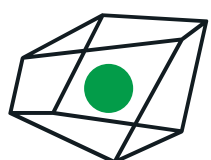

Lightstep provides unlimited cardinality, dynamic service maps, and immediate root cause correlation across traces, metrics, and logs anywhere in your system.

### A better way to manage change

The only constant in complex systems is change. Lightstep makes it easier to deliver on the changes you want and mitigate the ones you don't. This means increased CI/CD visibility, more effective SLO management, improved developer velocity, and less time spent responding to incidents and customer issues.

### Next-gen time series database

Lightstep's time series database was built by the team who created Google's metrics database ("Monarch"). It supports planet-scale data volume, rapid and flexible querying, and efficiently transforms data to enable enterprise metrics at a fraction of the cost of traditional providers.
